Contract4J is a framework to test JavaBeans-compliant classes by means of Design By Contract (DbC) The idea is to write tests for the contract provided by an object's public methods. ... Contract4J uses reflective calls to examine the object's properties and methods, then checks the contracts it imposes on those properties and methods, so you don't have to In this way, you can write tests against a class before it is even implemented. At runtime, if any of the contracts are not met, a violation of the rules is automatically reported. Contract4J's main advantages are: * Simple - you define your contracts as JavaBeans properties and set access modifiers for them. * Supports all JavaBeans conventions Contract4J was designed as the successor of JC4J - a tool that is no longer maintained. So, Contract4J is a general JavaBeans-based framework designed to add at runtime tests against all JavaBeans properties. That's why, Contract4J can actually be used for more than Design By Contract. You can also define a contract to validate the object's state after its construction. Of course, you have to state clearly what happens if that "contract" is not satisfied. So, to conclude, Contract4J is mainly a framework to write Design By Contract tests but it can be useful to check an object's state after its construction.
