Kryptor Full Version X64 (Updated 2022)

===== This script is designed to create keypairs for Cryptocat. All the communication between the client and the server is encrypted using this technique. Keypairs are generated with a "weaker" hash and "harder" HMAC key than what's used by Cryptocat. The master public key is generated by hashing using the "weaker" hash and MD5. After that, a public key of the correct length is created, and the hash and HMAC key is used to create a "stronger" hash and HMAC key. Then the "stronger" hash and HMAC key are hashed again with the stronger hash and MD5. These two hashes are the key for the AES-256 encryption. Usage: ===== Create a file called keypair with the file extension.keypair in the directory you wish to work. Fill out the content of this file with: OPENSSL_CONF=C:\OpenSSL\apps\openssl.cnf #Modify the command below to your desired parameters (your desired key and cipher). For example: #30M=4096RSA #30M=AES-256-CBC #30M=PBKDF2-HMAC-SHA1-96 #D=15 #R=1024 #K=30 #SCALAR=0 #STRING=client #SERVER=sntp.cryptocat.me #HOST=sntp.cryptocat.me #PORT=587 #Username (should be your username on Cryptocat) #Password (should be your password on Cryptocat) #An optional comment (will be used as the subject of your encrypted message to Cryptocat) #A random value (used as the public key for you on Cryptocat) Copy the content of the file into a command-line window and execute it. If you followed the example above, it should look something like this: // Get the hex values of the hashes for(Sa=0:Sa 77a5ca646e
