Taking photos A photo is captured by a lens and an image sensor. The lens gathers light and focuses it onto the sensor. In digital photography, the image sensor is a flat, square piece of silicon that transforms the light waves into a color image. Sometimes, it's also known as a CCD, for charge-coupled device. (Filling out the terminology of photographers is part of the fun.) The parts of the sensor, including the image sensor itself, are called a `_frame_` or `_image plane_`. You may want to use both a lens and a sensor in your camera because a lens on a compact camera is more likely to magnify a photo and make it larger and the image plane is smaller on a camera without a lens or in a point-and-shoot camera. (For more on the various parts of the camera, check out the later sidebar, "Seeing different parts of a camera," for a brief review.)
