CEO Craig Sharman says Brightcove's move to Avalanche will help its clients in four key ways: exposing more functionality through the protocol; enabling more efficient playback for its clients; supporting more devices and faster delivery of content; and improving publishing speed by reducing bandwidth usage. For its latest update, Brightcove is also overhauling the APIs that set its technology apart from WebRTC's competition and rivaling some of the security capabilities it has always boasted. The company has also launched API-based tools that let developers create large-scale experiments on its platform. Under the Experiment API, developers can integrate basic features of the new Brightcove's platform, all the way down to business model and technical capabilities. The goal, Sharman says, is to allow developers to start using the service and gain a better understanding while they are still in the planning stages, and evolve their goals after they can begin to evaluate their options

and adjust for success. "It's not a one-way street," says Sharman. "We're very much built around feedback and we want to access feedback from the marketplace as we continue to grow, which will validate the value that we bring as it relates to the economics, but the other side is about bringing more services to the marketplace. It's about bringing more tools to the JavaScript developer so they are able to develop and deliver these services." It creates a new edge for each image in the image sequence.

It's best suited for stitching simply because it doesn't need to combine multiple images or calculate and optimize exposure. The new version simply stitches in the information you choose.
